A STUDY ON POLYPHARMACY AMONG GERIATRIC PATIENTS AGED ≥65 YEARS IN A TERTIARY CARE HOSPITAL

INTRODUCTION AND RATIONALE:-

Polypharmacy, the concurrent use of multiple prescription or over-the-counter medications, is a growing problem in the United States. Although polypharmacy may occur in all age groups, it is a common occurrence in elderly people. A number of studies conducted during the past 10 years have revealed that patients age 65 and older according to WHO use an average of two to six prescribed medications and one to 3.4 non-prescribed medications on a regular basis. The problem of polypharmacy is so extensive that it was designated as the principal medication safety issue in the Healthy People 2000 document.

OBJECTIVES:-

1. To assess the prevalence of polypharmacy among geriatric patients in certain conditions.

Inclusion:-

- Hypertension
- Diabetes mellitus
- Asthma

Exclusion:-

- Cancer
- IPD patients
- ICU patients
- Chronic illness

REVIEW OF LITERATURE:-

[Content to be added — please provide the literature review.]

METHODOLOGY:-

[Content to be added — please provide methodology, inclusion/exclusion criteria, data collection, and analysis details.]

RESULTS:-

[Content to be added — please provide results, rates, and tables.]

DISCUSSION:-

[Content to be added — please provide the discussion.]

CONCLUSION:-
